

15 September 2026

Dear Mr. Zuckerman,

Metalphoto® photosensitive anodized aluminum is designed for permanent identification applications including aerospace, defense, and heavy equipment requiring exceptional durability and long-term legibility. Because the photographic image is sealed within the anodized aluminum layer, Metalphoto demonstrates outstanding resistance to environmental degradation, including UV exposure, abrasion, corrosion, chemicals, and heat. Based on its demonstrated performance in harsh outdoor and industrial environments, as well as its successful use in critical applications since 1950, it is reasonable to expect that Metalphoto nameplates and labels will remain legible for 100 years or more when installed in a normal indoor environment, provided they are not subjected to unusual physical damage or conditions.

Kind Regards,

Andrew Marvin
